

Subject: Frac Sand Sentinel #251 02-17-2019 Potential Radiation Risks. Recent findings.

Be prepared to discover some shocking findings as you read these reports.

*.....keeping watch on
the industry*

Issue:#251
Date: Feb. 17, 2019

Oil and gas concerns may be more far reaching in terms of their impact on people in a variety of ways.

Brine is being used more frequently these days on icy and snow covered roads, most often to reduce amounts of rock salt from impacting the environment. It also acts as a deicer and roads, side walks, and driveways dry out much more quickly. At least these two reasons are given as

rationale for brine use in several states and counties.

Having read countless articles over the past months about this issue, I feel it is important to share at least one of them sent to me recently. Some of the brines are being manufactured not only for driveway and sidewalk use but also for application to roads have high concentrations of RADIOACTIVITY. Read about this using this link:

<https://www.cleveland.com/metro/2019/02/ohio-legislature-prepares-to-address-law-for-radioactive-road-deicer.html>

I would be happy to share other articles and studies if anyone is interested in knowing more about the potential threat to human and animal welfare.

Do you have a pool? Just this week, I was shocked to learn about another well known manufacturer using waste products to produce Pool Salt. PUBLIC HERALD, written and published in Pennsylvania, came out with a very troubling report as a result of their investigative reporting

techniques! Joshua and his partner, Melissa, identified very interesting findings and the general public should know about them:

Drinking water issues surface in Pennsylvania as they have in the midwest around frac sand mining facilities. Industries are often protected by the DEP in PA or the DNR here in Wisconsin from Public Herald.

In this podcast, Joshua Pribanic interviews Dr. John Stolz from Duquesne University.
